(57) **ABSTRACT**

A colored laundry detergent is provided that brightens on  
exposure to light.

**12 Claims, No Drawings**

1

**BRIGHT DETERGENT COMPOSITION**

## FIELD OF INVENTION

The invention concerns detergent formulations with dyes.

## BACKGROUND OF THE INVENTION

WO2011/011799 (Procter and Gamble) discloses violet thiophene dyes containing a anionic group covalently bound to alkoxy groups for use in laundry detergents for whitening textiles.

To obtain other aesthetic colours in the detergent, violet anionic thiophene dyes are mixed with additional dyes. Colour brightness is a key attribute of colour that the consumer desires. Consumers do not like dull colours.

## SUMMARY OF THE INVENTION

We have found that mixtures of violet thiophene dyes and blue triphenyl methane dyes become brighter blue on exposure to sunlight.

In one aspect the present invention provides a detergent composition comprising:

- (i) from 0.0001 to 0.1 wt %, preferably from 0.0005 to 0.005 wt %, of a violet anionic alkoxyated thiophene dye comprising an anionic group covalently bound to alkoxy groups;
- (ii) a blue triphenyl methane dye, wherein the molar ratio of the blue triphenyl methane dye to violet anionic alkoxyated thiophene dye is in the range from 15:1 to 1:15; and,
- (iii) from 5 to 70 wt % of surfactants selected from anionic and non-ionic surfactants.

The detergent composition may be in any solid physical form, preferably granular or liquid, most preferably a liquid detergent composition. The liquid detergent compositions are preferably isotropic.

## DETAILED DESCRIPTION OF THE INVENTION

## Surfactant

In general, the surfactants of the surfactant system may be chosen from the surfactants described "Surface Active Agents" Vol. 1, by Schwartz & Perry, Interscience 1949, Vol. 2 by Schwartz, Perry & Berch, Interscience 1958, in the current edition of "McCutcheon's Emulsifiers and Detergents" published by Manufacturing Confectioners Company or in "Tenside-Taschenbuch", H. Stache, 2nd Edn., Carl Hauser Verlag, 1981. Preferably the surfactants used are saturated.

Preferably the composition comprises between 5 to 70 wt % of surfactants selected from anionic and non-ionic surfactants, most preferably 10 to 30 wt %. The fraction of non-ionic surfactant is preferably from 0.05 to 0.75 of the total wt % of the anionic and non-ionic surfactant, preferably from 0.1 to 0.6, more preferably from 0.3 to 0.6, most preferably from 0.45 to 0.55.

## Non-ionic

Suitable nonionic detergent compounds which may be used include, in particular, the reaction products of compounds having a hydrophobic group and a reactive hydrogen atom, for example, aliphatic alcohols, acids, amides or alkyl phenols with alkylene oxides, especially ethylene oxide

2

either alone or with propylene oxide. Preferred nonionic detergent compounds are  $C_6$  to  $C_{22}$  alkyl phenol-ethylene oxide condensates, generally 5 to 9 EO, i.e. 5 to 9 units of ethylene oxide per molecule, and the condensation products of aliphatic  $C_8$  to  $C_{18}$  primary or secondary linear or branched alcohols with ethylene oxide, with 5 to 9 EO.

The non-ionic surfactant preferably contains an alkyl alkoxyate. The alkyl alkoxyate is preferably and alkyl ethoxyate, with formula  $R^1(OCH_2CH_2)_pOH$ : where  $R^1$  is an alkyl group that may be primary or secondary and contains  $C_{10}$ - $C_{16}$  carbon atoms. Most preferably  $R^1$  is a  $C_{12}$ - $C_{15}$  primary alkyl chain.  $p$  is from 5 to 9, preferably from 7 to 9.

The preferred alkyl alkoxyate is preferably greater than 50% of all the non-ionic present, more preferably greater than 70%, most preferably greater than 90%.

## 1) Anionic Surfactants

Suitable anionic detergent compounds which may be used are usually water-soluble alkali metal salts of organic sulphates and sulphonates having alkyl radicals containing from about 8 to about 22 carbon atoms, the term alkyl being used to include the alkyl portion of higher acyl radicals. Examples of suitable synthetic anionic detergent compounds are sodium and potassium alkyl sulphates, especially those obtained by sulphating higher  $C_8$  to  $C_{18}$  alcohols, produced for example from tallow or coconut oil, sodium and potassium alkyl  $C_9$  to  $C_{20}$  benzene sulphonates, particularly sodium linear secondary alkyl  $C_{10}$  to  $C_{15}$  benzene sulphonates; and sodium alkyl glyceryl ether sulphates, especially those ethers of the higher alcohols derived from palm kernel, tallow or coconut oil, methyl ester sulfonates, and synthetic alcohols derived from petroleum. Most preferred anionic surfactants are sodium lauryl ether sulfate (SLES), particularly preferred with 1 to 3 ethoxy groups, sodium  $C_{10}$  to  $C_{15}$  alkyl benzene sulphonates and sodium  $C_{12}$  to  $C_{18}$  alkyl sulphates. The chains of the surfactants may be branched or linear.

Soaps are also preferred. The fatty acid soap used preferably contains from about 16 to about 22 carbon atoms, preferably in a straight chain configuration. The anionic contribution from soap is preferably from 0 to 30 wt % of the total anionic.

Preferably, at least 50 wt % of the anionic surfactant are selected from: sodium  $C_{11}$  to  $C_{15}$  alkyl benzene sulphonates; and, sodium  $C_{12}$  to  $C_{18}$  alkyl sulphates. Even more preferably, the anionic surfactant is sodium  $C_{11}$  to  $C_{15}$  alkyl benzene sulphonates.

## Violet Thiophene Dye

The anionic alkoxyated thiophene dye is violet in colour in aqueous solution. In aqueous solution, they preferably have an optical absorption maximum in the visible of 550 to 590 nm, more preferably 560 to 580 nm. This is measured using a UV-VIS spectrometer in aqueous solution.

The dye has a maximum molar extinction coefficient at a wavelength in the range 400 to 700 nm of at least  $30\,000\text{ mol}^{-1}\text{ L cm}^{-1}$ , preferably greater than  $50\,000\text{ mol}^{-1}\text{ L cm}^{-1}$ .

The anionic alkoxyated thiophene dyes are preferably of the following generic form: Dye- $NR_1R_2$ . The  $NR_1R_2$  group is attached to an aromatic ring of the dye. Where at least one of  $R_1$  and  $R_2$  are independently selected from polyoxyalkylene chains having 2 or more repeating units and preferably having 2 to 12 repeating units, wherein the polyalkylene chain is terminated by anionic group. Examples of polyoxyalkylene chains include ethylene oxide, propylene oxide, glycidol oxide, butylene oxide and mixtures thereof.

3

The dye is preferably of the form:

where D is a thiophene group and the A group may be substituted by further uncharged organic groups. Preferred uncharged organic groups are  $\text{NHCOCH}_3$ , methyl, ethyl, methoxy and ethoxy.

Preferably the polyoxyalkylene chains are polyethoxylates with preferably 2 to 7 ethoxylates.

The anionic alkoxyated thiophene dye is preferably a mono-azo dye.

Preferably the only charged species on the dye is a sulphonate or carboxyl ate group; most preferably the only charged species on the dye is a sulphonate ( $\text{SO}_3^-$ ).

Preferred examples of the dye are:

Most preferably the dye is of the form:

where n is from 0, 1, 2, 3, 4, 5, 6 or 7 and Where m is from 0, 1, 2, 3, 4, 5, 6 or 7.

#### Blue Dye

The Blue dye contains a triphenylmethane chromophore.

The blue dye is blue in colour in aqueous solution. Blue includes green-blue. In aqueous solution, the blue dye preferably has an optical absorption maximum in the visible of 590 to 660 nm, more preferably 600 to 650 nm. This is measured using a UV-VIS spectrometer in aqueous solution.

Many such dyes are listed under Acid Blue dyes in the Colour Index (Society of Dyers and Colourists and American Association of Textile Chemists and Colorists).

The molar ratio of triphenyl methane blue dye to violet thiophene dye is in the range from 15:1 to 1:15, preferably in the range from 10:1 to 1:10, and more preferably in the range from 1:1 to 1:3.

Preferably the blue dye is sulphonated and/or bears a poly (alkoxy) chain. Most preferably the dye is sulphonated.

4

Preferred triphenyl methane dyes contain 2 amine groups, which are bound to separate aromatic rings of the dye. Preferred triphenylmethane dyes are Acid Blue 1, Acid Blue 3; Acid Blue 5, Acid Blue 7, Acid Blue 9, Acid Blue 11, Acid Blue 13, Acid Blue 15, Acid Blue 17, Acid Blue 24, Acid Blue 34, Acid Blue 38, Acid Blue 75, Acid Blue 83, Acid Blue 91, Acid Blue 97, Acid Blue 93, Acid Blue 93:1, Acid Blue 97, Acid Blue 100, Acid Blue 103, Acid Blue 104, Acid Blue 108, Acid Blue 109, Acid Blue 110, and Acid Blue 213.

## EXPERIMENTAL

### Example 1

Detergent solutions were created containing 7.28 wt % anionic surfactant and 7.28 wt % non-ionic surfactant. The anionic surfactant was linear alkyl benzene sulfonate. The non-ionic was a from primary alkyl ethoxylate with a primary C12-C15 alkyl group and 7 moles of ethoxylate per 1 mole of alkyl group. The anionic thiophene dye (0.001 wt %):

was added to the formulations, such that the optical density (1 cm) at the maximum absorption in the range 400-700 nm was ~1. The solution was violet in colour. The sample was split into 4 aliquots, blue dyes added at a level, such that if added to detergent solution alone without the violet dye they would have an optical density at the max of ~1. The UV-VIS spectra of the formulations were measure in a 1 cm plastic cuvette. The solutions were blue in colour.

The value of the optical density at the maximum absorption of the detergent in the visible (400-700 nm) was measured, OD(max) and also the value at 450 nm, OD(450).

OD(max) is a measure of the desired colour and OD(450) a measure of the undesired (dulling colour).

The fraction Brightness=OD(max)/OD(450) provides a measure of the brightness of the solution, the larger the fraction the brighter the solution.

The formulations in the plastic cuvettes were irradiated in a weatherometer for 30 minutes with simulated sunlight (385 W/m<sup>2</sup> 300-800 nm). The UV-VIS spectra were then recorded again.

The change in brightness was calculated according to the following formula:

$$\text{Brightness} = \text{Brightness (final)} - \text{Brightness (initial)}$$

A positive value indicates an increase in Brightness.

The experiments were repeated four times and the results summarised in the table below:

Blue dye chromophore	Blue dye	• Brightness	95% confidence limits
Azo (reference)	Acid Blue 29	-0.87	0.20
Anthraquinone (reference)	Acid Blue 80	0.22	0.39
Phenazine (reference)	Acid Blue 59	0.33	0.19
Triphenylmethane	Acid Blue 1	3.32	0.28

## 5

The mixture of violet anionic thiophene dye and blue triphenylmethane dye increases the brightness of the detergent solution on irradiation.

## Example 2

## Photostability of the Blue Dyes

Detergent solutions were created containing 7.28 wt % anionic surfactant and 7.28 wt % non-ionic surfactant. The anionic surfactant was linear alkyl benzene sulfonate. The non-ionic was a primary alkyl ethoxylate with a primary C12-C15 alkyl group and 7 moles of ethoxylate per 1 mole of alkyl group. Blue dye was added at level such that the optical density (1 cm) at the maximum absorption of the blue dye was ~1.

The UV-VIS spectra of the formulations were measure in a 1 cm plastic cuvette. The solutions were blue in colour.

The value of the optical density at the maximum absorption of the detergent in the visible (400-700 nm) was measured, OD (max). The formulations in the plastic cuvettes were irradiated in a weatherometer for 30 minutes with simulated sunlight (385 W/m<sup>2</sup> 300-800 nm). The UV-VIS spectra were then recorded again.

The percentage of blue dye lost (% dye lost) due to photoradiation was calculated using the equation:

$$\% \text{ dye lost} = 100 \times (1 - \text{OD}(\text{after irradiation}) / \text{OD}(\text{before irradiation}))$$

The experiment was repeated four times for each of the blue dyes of example 1.

The results are given in the table below.

Blue dye chromophore	Blue dye	% dye lost	95% confidence limits
Azo (reference)	Acid Blue 29	61.3	4.1
Anthraquinone	Acid Blue 80	10.0	0.8
Phenazine	Acid Blue 59	42.8	1.7
Triphenylmethane	Acid Blue 1	79.0	6.5

No correlation exists between the photostability of the blue dyes alone and the increase brightness observed in example 1.

Photostability increases in the order

Acid Blue 1 (lowest); Acid Blue 29; Acid Blue 59; Acid Blue 80 (highest).

On irradiation the brightness increase in the order

Acid Blue 1 (best); Acid Blue 59; Acid Blue 80; Acid Blue 29 (worst)

We claim:

1. A detergent composition comprising:

(i) from 0.0001 to 0.1 wt % of a violet anionic alkoxyated thiophene dye comprising a anionic group covalently bound to alkoxy groups; and,

(ii) a blue triphenyl methane dye, wherein the molar ratio of the blue triphenyl methane dye to the violet anionic alkoxyated thiophene dye is in the range from 1:1 to 1:3; and,

(iii) from 5 to 70 wt % of surfactants selected from anionic and non-ionic surfactants.

2. A detergent composition according to claim 1, wherein the detergent composition is a liquid detergent composition.

3. A detergent composition according to claim 1, wherein the violet anionic alkoxyated thiophene dye is of the form:

## 6

wherein D is a thiophene group and each of R<sub>1</sub> and R<sub>2</sub> is

selected from the group consisting of ethyl, a compound of formula and polyoxyalkylene chains having 2 or more repeating units and wherein at least one of the polyoxyalkylene chains of R<sub>1</sub> or R<sub>2</sub> is terminated by an anionic group, with the proviso that at least one of R<sub>1</sub> and R<sub>2</sub> contains polyoxyalkylene chains having 2 or more repeating units and wherein at least one of the polyoxyalkylene chains of R<sub>1</sub> or R<sub>2</sub> is terminated by anionic group.

4. A detergent composition according to claim 3, wherein the polyoxyalkylene chains have 2 to 12 repeating units.

5. A detergent composition according to claim 4, wherein the polyoxyalkylene chains have 2 to 7 repeating units.

6. A detergent composition according to claim 3, wherein polyoxyalkylene units are ethoxylates.

7. A detergent composition according to claim 1, wherein the only charged species on the violet anionic alkoxyated thiophene dye is a sulphonate or carboxylate group.

8. A detergent composition according to claim 7, wherein the only charged species on the violet anionic alkoxyated thiophene dye is a sulphonate (SO<sub>3</sub>) group.

9. A detergent composition according to claim 3, wherein ring A is substituted by a group selected from: NHCOCH<sub>3</sub>, methyl, ethyl, methoxy and ethoxy.

10. A detergent composition according to claim 3, wherein the violet anionic alkoxyated thiophene dye is selected from:

wherein n is selected from: 0; 1; 2; 3; 4; 5; 6; and 7 and m  
is selected from: 0; 1; 2; 3; 4; 5; 6; and 7.

**11.** A detergent composition according to claim 1, wherein  
the blue dye is covalently bound to a group selected from  
sulphonated and a polyalkoxy chain.

**12.** A detergent composition according claim 11, wherein  
the blue dye is selected from: Acid Blue 1, Acid Blue 3; Acid  
Blue 5, Acid Blue 7, Acid Blue 9, Acid Blue 11, Acid Blue 13,  
Acid Blue 15, Acid Blue 17, Acid Blue 24, Acid Blue 34, Acid  
Blue 38, Acid Blue 75, Acid Blue 83, Acid Blue 91, Acid Blue  
97, Acid Blue 93, Acid Blue 93:1, Acid Blue 97, Acid Blue  
100, Acid Blue 103, Acid Blue 104, Acid Blue 108, Acid Blue  
109, Acid Blue 110, and Acid Blue 213.
